795. Number of Subarrays with Bounded Maximum

Solved

Medium | Topics | Companies

Given an integer array `nums` and two integers `left` and `right`, return *the number of contiguous non-empty* ***subarrays*** *such that the value of the maximum array element in that subarray is in the range* `[left, right]`.

The test cases are generated so that the answer will fit in a **32-bit** integer.

Example 1:

```
Input: nums = [2,1,4,3], left = 2, right = 3
Output: 3
Explanation: There are three subarrays that meet the requirements: [2], [2, 1], [3].
```

Example 2:

```
Input: nums = [2,9,2,5,6], left = 2, right = 8
Output: 7
```

Constraints:

2.5K | 35 | 11 Online

Code

C++ | Auto

```cpp
class Solution {
public:
    int countSubarrays(vector<int>&nums,int bound){
        int count=0;
        int current=0;
        for(int n:nums){
            if(n<=bound){
                current++;
            }
            else{
                current=0;
            }
            count+=current;
        }
        return count;
    }
    int numSubarrayBoundedMax(vector<int>& nums, int left, int right) {
        return countSubarrays(nums,right)-countSubarrays(nums,left-1);
    }
};
```
